## Amendments to the Claims:

Without prejudice, this listing of the claims replaces all prior versions and listings of the claims in the present application:

## **Listing of Claims:**

1. (Currently Amended) A method for producing a conductive <u>layered</u> coating on an insulating substrate, comprising:

equipping, in selected regions, at least one surface of an electrically insulating substrate with a coating of an electrically highly conductive first metal, the coating being structured as conductor paths;

cleaning the at least one coated surface;

seeding the coating with seeds of a second metal;

depositing a layer including an alloy of the second metal onto the coating seeded with the seeds of the second metal;

firing the substrate deposited with the layer of the second metal to form the conductive layered coating, the firing being performed at a temperature below the melting point of the first metal, the second metal and the alloy; and

contacting a gold bonding wire to the first metal conductive layered coating, wherein:

the substrate includes one of a ceramic and an LTCC, the first metal includes silver, and the second metal includes palladium.

- 2. (Canceled)
- 3. (Canceled)
- 4. (Previously Presented) The method as recited in Claim 1, wherein: in the depositing of the layer of the second metal, palladium is deposited at a
  - ratio of from 0.1 to 50% percent by weight of the alloy.
- 5. (Previously Presented) The method as recited in Claim 1, wherein:
  in the depositing of palladium, the palladium is deposited in such a way that a
  concentration of greater than 20% percent by weight palladium in the alloy results.
- 6. (Original) The method as recited in Claim 1, wherein:

the seeding and the depositing are performed according to an electroless procedure.

- 7. (Original) The method as recited in Claim 1, wherein: the firing is performed at a temperature between 830 and 870°C.
- 8. (Original) The method as recited in Claim 1, wherein: the firing is performed at a temperature of 850°C.

## 9 -10. (Canceled)

11. (New) A method for producing a conductive layered coating on an electrically insulating substrate, comprising:

equipping, in selected regions, at least one surface of the electrically insulating substrate with a coating of a first metal structured as a conductor path;

cleaning the at least one coated surface;

seeding the at least one coated surface with seeds of a second metal;

depositing a layer including an alloy of the second metal onto the at least one seeded coated surface; and

firing the substrate deposited with the layer to form the conductive layered coating, the firing being performed at a temperature below the melting point of the first metal, the second metal and the alloy.

- 12. (New) The method of claim 11, wherein substrate include an LTCC;
- 13. (New) The method of claim 12, wherein the first metal includes silver and the second metal include palladium.
- 14. (New) The method of claim 13, further comprising: contacting a gold bonding wire to the conductive coating.
